

# Did Vaccines Really Save us?

**Australian** graphs and statistics are based on the official death numbers as recorded in the Official Year Books of the Commonwealth of Australia. It is also worth noting that between 1860 and 1915 the death rate declined from 20.86 (1860) to 10.66 (1915), mostly in relation to the infectious diseases.

VACCINATIONS ARE INEFFECTIVE IN PREVENTING THE DISEASES THAT THEY ARE SUPPOSED TO PREVENT.  
**VACCINATIONS DO NOT WORK!**

It could be acceptable in some quarters to have damaged and dead children from vaccinations if epidemics on the other hand were prevented, however they are ineffective therefore, improvement in social conditions are effective; (clean water supplies, sewerage – faeces, urine removed from streets and drains – money for women to buy food for their children – cleanliness etc). These are the conditions that lowered the **death rates**;-  
**NOT VACCINATIONS!**

Ian Sinclair has given permission to use the graphs on pages 14 - 15 - 18, they have been extracted from his book: "VACCINATION The Hidden Facts"

**VACCINE INTRODUCTION**

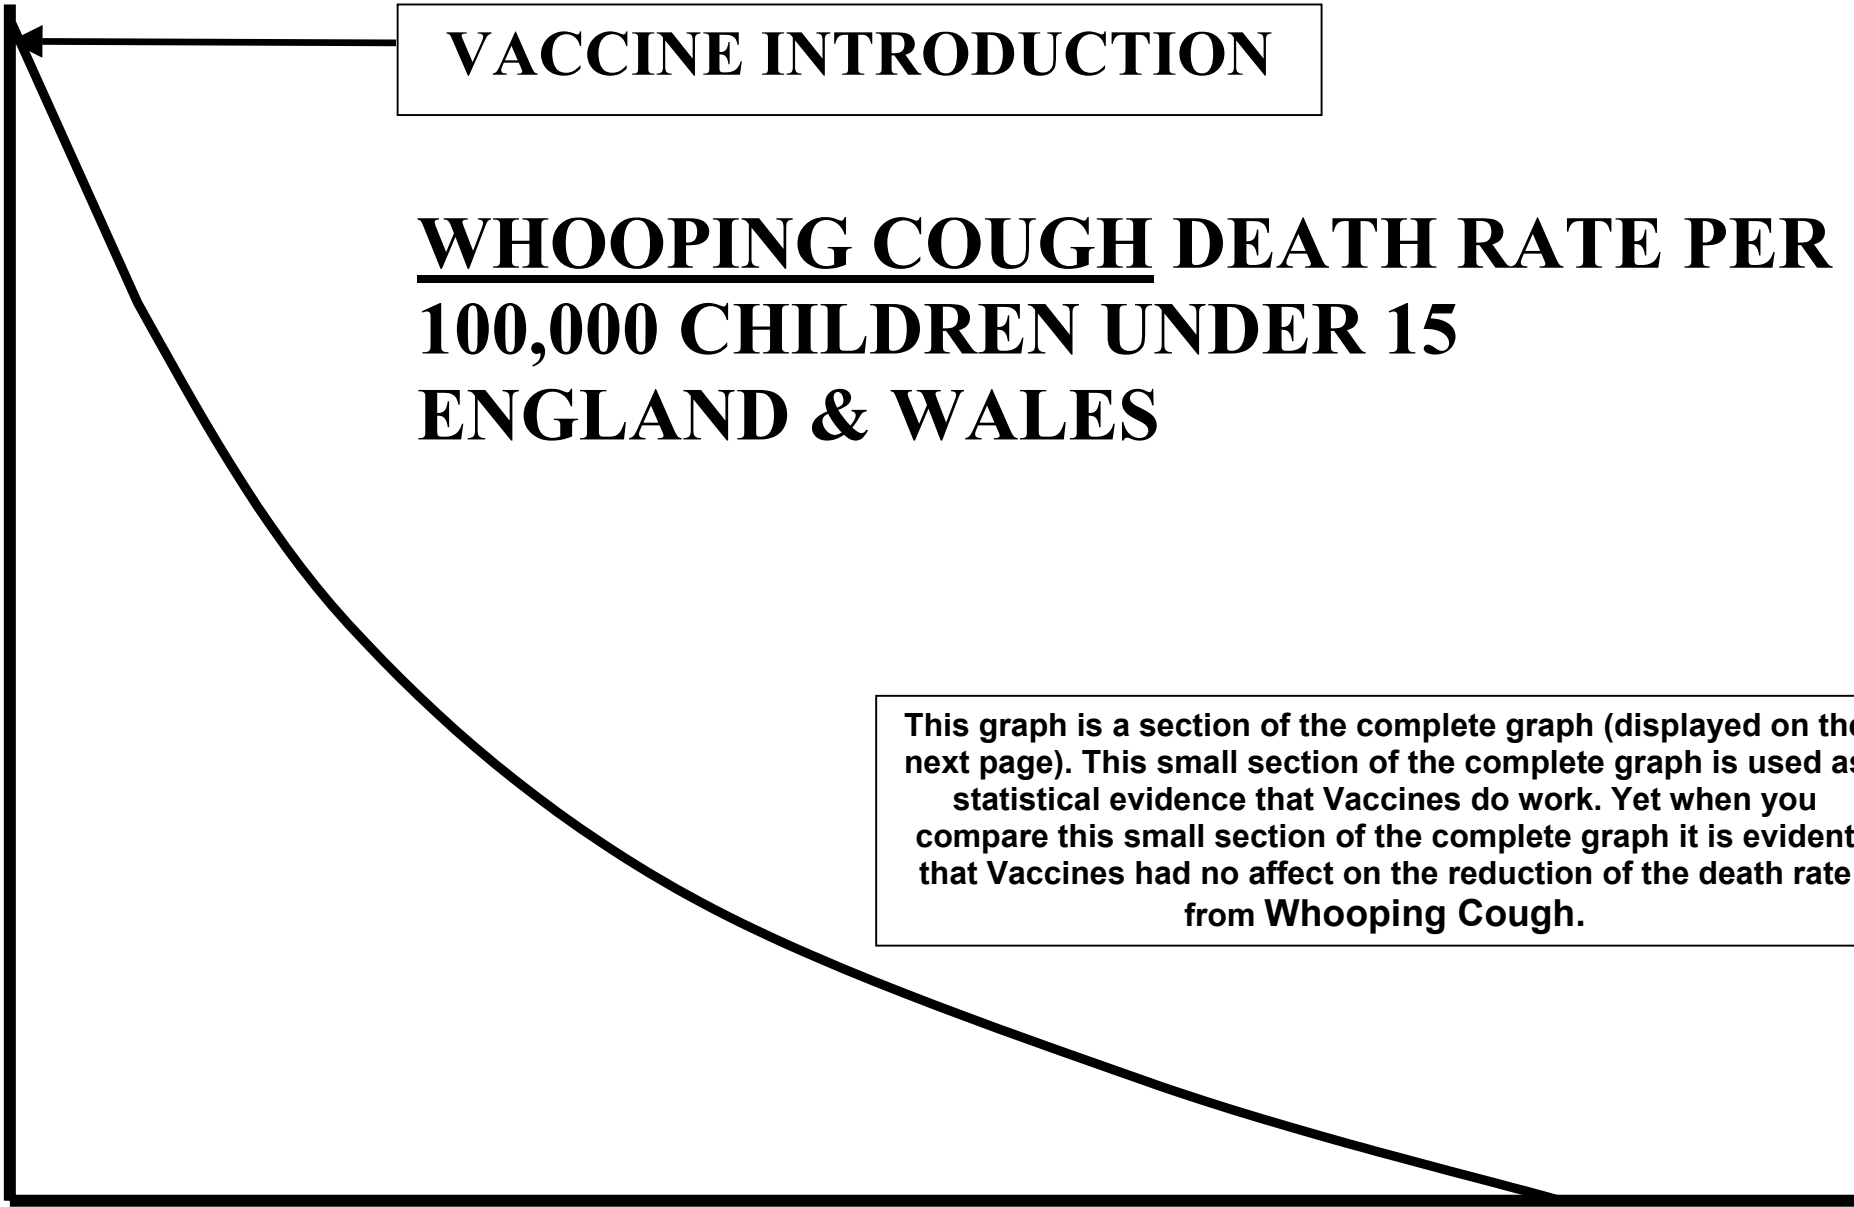

**WHOOPING COUGH DEATH RATE PER  
100,000 CHILDREN UNDER 15  
ENGLAND & WALES**

This graph is a section of the complete graph (displayed on the next page). This small section of the complete graph is used as statistical evidence that Vaccines do work. Yet when you compare this small section of the complete graph it is evident that Vaccines had no affect on the reduction of the death rate from Whooping Cough.

1990

# WHOOPING COUGH DEATH RATE PER 100,000 CHILDREN UNDER 15 IN ENGLAND & WALES

*VACCINATIONS DO NOT WORK!*  
**THEY ONLY DAMAGE.**
