Stealth Virus

Dr John Martin discovered an unusual virus in cultures isolated from at least two patients with chronic fatigue syndrome, a cytomegalovirus like stealth virus. These viruses are termed “stealth” because they fail to evoke an inflammatory reaction in the patients from whom they were isolated because the viruses lack target antigens for recognition by the body’s cellular immune system. Comparison of DNA sequences with other known viruses showed that this stealth virus was closely related to a strain of simian cytomegalovirus found in African Green monkeys (Martin et al., 1995). The most likely source for infection by the African green monkey virus is the live polio vaccine. This study provides further evidence that the polio vaccine or other vaccines produced in monkey cell cultures or monkey tissues could harbour unrecognizable simian viruses capable of causing chronic infections in humans.

Dr. Martin has identified stealth viral infection in all of the following conditions: chronic fatigue syndrome, autism,(Martin, 1995), fibro myalgia, Gulf War Syndrome, depression, and dementia in adults, and attention deficit and behavioural disorders in children. Stealth viral infection can also cause severe encephalopathy (Martin, 1995).

For a complete discussion of stealth virus see www.ccid.org.

Other Viruses

Viruses can only be detected in vaccines if researchers know what they are trying to find. Monkey viruses have been transferred from monkeys to humans through the live polio vaccine because manufacturers did not know about their existence. It is possible that still other unidentified viruses that cause disease in humans could be contained in vaccines, their discovery awaiting further research findings. Infants exposed to these monkey viruses could develop infections transmitted from monkeys to humans, the same type of infections suspected in the spread of Aids, chronic fatigue syndrome, autism, and cancer. Laboratory analysis of vaccines has identified dozens of foreign protein contaminants in vaccines, including a long list of pathogens. According to one scientist who has come forward, the list is forbidding. “In polio vaccine, we found acanthamoeba, which is a so-called ‘brain-eating’ amoeba. Simian foamy virus in the rotavirus vaccine. Bird-cancer viruses in the MMR vaccine.....

TO REALISE THE FULL STORY THIS BOOK IS A MUST READ.
